Indicated in all age groups. Children (including infants and neonates) & adults (including the elderly). SOJOURN™ may be used for anaesthesia during Caesarean section.

Due to the low solubility of SOJOURN™ in blood, the alveolar concentrations rapidly increase upon induction and rapidly decrease upon cessation of the inhaled agent. 5-8 % of SOJOURN™ is metabolised.

SOJOURN™ is indicated for induction and maintenance of general anaesthesia in adult and paediatric patients for inpatient and outpatient surgery.

Surgical levels of anaesthesia can usually be achieved with concentrations of 0,5 – 3 % SOJOURN™ with or without the concomitant use of nitrous oxide. Elderly: Lesser concentrations of SOJOURN™ are normally required to maintain surgical anaesthesia.

Dosage should be individualised and titrated to the desired effect according to the patient's age and clinical status. Inspired concentrations of up to 8 % SOJOURN™ usually produces surgical anaesthesia in less than 2 minutes in both adults and children.

The MAC of SOJOURN™ in oxygen was determined to be 2,1 % for a 40-year-old adult.
